I am an architect and researcher with a keen interest in the relationship between architecture and urban planning. I believe that a home, as a private space, gains its true meaning within its context, and I view contextualism as a solution to avoid the loss of identity in modern machine architecture. Additionally, due to the significant impact of designed spaces on human behavior, my goal is to create environments that address social needs, foster positive behaviors, and contribute to social sustainability and the enhancement of urban quality of life. In this regard, my master's thesis and other studies have been directed toward identifying the mass and spatial patterns that shape successful social spaces within traditional neighborhoods, and I aim to reinterpret these patterns in modern designs.
